

Pulse Secure expands secure access platform hosting to Europe

Pulse Secure has announced a new European hosting option for its Pulse Workspace mobility management solution and Pulse One centralised management solution. Both cloud based products fully meet EU Data Protection laws and compliance standards including ISO 27001, SOC 1, PCI DSS Level 1, and are delivered from Amazon Web Services data centre facility in Frankfurt, Germany.

“This launch is a key part of our ongoing commitment to meet the local data protection needs of our global customer base,” explained Prakash Mana, Head of Product Management for Pulse Secure. “Our base of over 20,000 customers represents some of the biggest names in industries such as finance, healthcare, government and manufacturing. Many of these are headquartered outside the USA, leading to specific jurisdictional and compliance requirements. Ensuring that we have a reliable and compliant service across each region enables our customers to quickly and securely deliver Secure Access to their workers.”

Pulse Secure continues to focus on current regulatory requirements, such as the new EU General Data Protection Regulation (GDPR), as well as future amendments highlighted by the evolving nature of security standards.
