

Pulse Secure Application Delivery

HIGHLIGHTS

- Provides an Application Delivery and Load Balancing solution purpose-built for high-performance Network Functions Virtualization (NFV)
- Uniquely customizable, with comprehensive RESTful APIs for service management, and TrafficScript, a powerful data plane scripting technology
- Unmatched scale and performance, able to scale-up with the latest generation of multi-core CPUs, and scale out with N+M clustering for reliability and throughput

The Leading Virtual Application Delivery Controller (ADC) Designed for Any Cloud or Virtual Environment

Pulse Secure vADC: Better for development, better for deployment, and better for delivery.

Application delivery controllers (ADCs) are an important part of the modern application platform. They provide key functionality to support applications and valuable tools to support operations. Their monitoring and debugging capabilities also help deliver reliable applications with predictable performance.

For the highest levels of application awareness and service isolation, individual ADCs need to be dedicated to each application, and located close to application servers—or even co-located with the application itself.

Designed with this in mind, Pulse Secure vADC is a software-defined ADC with integrated web content optimization (WCO) and web application firewall (WAF) capability designed to deliver application services in the face of these challenges.

Pulse Secure vADC is a new breed of ADC that is natively designed for virtualization and cloud portability. As a pure software solution intended

for the widest variety of deployments, the Pulse Secure vADC family enables a more flexible application delivery strategy and provides a common delivery and control platform that can grow with your business.

Pulse Secure vADC software is designed to load balance traffic globally among servers, manage bandwidth, shape traffic, and monitor service levels.

Pulse Secure vADC Product Family

Pulse Secure vADC is designed to make applications faster, reliable, and secure. It works within cloud environments and is easily integrated into an application stack. It is the industry's first complete software-defined Application Delivery Controller (ADC), freeing applications from the constraints of traditional monolithic load balancers.

While traditional ADCs deliver scalability and reliability for enterprise and web applications within the data center, Pulse Secure vADC software goes further to deliver high performance and availability and accelerating applications, including those based in virtual and cloud platforms.

The Software-Defined ADC Advantage

Traditional load balancers and application delivery controllers (ADCs) simply hand off connections among a few servers to improve uptime.

Software-defined ADCs, designed for the hybrid enterprise provide the required availability, scalability, security, and user experience expected for today's website and business applications.

Feature	Description
Flexibility	Application owners look at ADCs as a key control point for a distributed application because they see every single user request and response. However, if the ADC isn't dynamic and flexible like the application itself, the app owner is essentially developing with one hand tied behind his back.
Layer 7 Intelligence	A Layer 7 ADC allows for application level operations and optimizations. It can make decisions based on the application, the user, a given page, a particular kind of response, and much more. It can even change the behavior of the application if necessary. With deep application level intelligence, ADCs can protect advanced threats to security, including SQL injection attacks, cross-side scripting (XSS) attacks, and denial-of-service threats.
Improved User Experience	Software-defined ADCs do more than boost data center efficiency: they go further to ensure that users have a fast, reliable experience. They tap into the application content and deliver it fast and consistently every time. This allows ADCs to give users a better experience by reacting to browser platform, user requirements, and even user location and other characteristics.
Cloud-Readiness	Traditional load balancers and legacy application delivery controllers can't provide the type of diversity, portability, programmability and granular application-level control readily available with Pulse Secure. Software-defined ADCs are designed to work across any public or private cloud.
Developer Support	Imagine your developers running a dedicated on-demand ADC in their own development environments. At their fingertips, they'd have Layer 7 functionality, scale, offload, content optimization, and security components all built into one toolset. They'd be able integrate and test apps while running the ADC has part of the application stack. Your developers can easily use the ADC when it's best suited for the job. And best of all, they can do it for free with the Pulse Secure Community Edition.

Figure 1. The Pulse Secure Virtual Traffic Manager inspects and processes application traffic, with full payload inspection and streaming.

1. Pulse Secure Virtual Traffic Manager

The Pulse Secure Virtual Traffic Manager provides unprecedented scale and flexibility to deliver applications across the widest range of environments, from physical and virtual data centers to public and hybrid clouds. It can increase server efficiency by up to 3x and boost the throughput of application servers by up to 50%, while at the same time reducing response times through dynamic caching, and both local and global load balancing. It reduces the strain placed on application infrastructure with network-level buffering, protocol optimizations, and application-specific measures such as dynamic compression and caching.

The Pulse Secure Virtual Traffic Manager delivers:

Improved reliability and scalability	Increased security	Application performance	Integration and control
Health and performance monitors balance client requests across the fastest servers. Seamless application scaling protects against compound failures at all levels.	Protect applications with server isolation, request and response scrubbing, request validation, and protective traffic shaping. Also defend against direct attacks, invalid or malformed requests, and malicious or incidental flash floods.	Offload compute-intensive tasks while integrating HTTP content caching for reduced load on your infrastructure. TCP offload, traffic buffering, and concurrency control let applications run at peak performance.	Implement traffic management policies with Pulse Secure RuleBuilder™ and Pulse Secure TrafficScript™ language, or create Java™ extensions for complex business rules. Integrate the Pulse Secure Virtual Traffic Manager within existing application management and orchestration infrastructure with REST APIs.

Figure 2. The Pulse Secure Services Director and application delivery-as-a-service.

2. Pulse Secure Services Director

Why pay for ADC capacity you don't need or use? The Pulse Secure Services Director automates the deployment, licensing, and metering of your application delivery services. It gives each of your applications a dedicated ADC instance, in a high-density multi-tenanted platform.

With this elastic deployment architecture, you can scale individual ADC instances up and down to match changes in workload. And with a new services enabling business model, you are in control of your costs. In fact, you can allocate the charges to each client application based on hourly metering to offer ADC-as-a-service to your customers and applications.

The Pulse Secure Services Director delivers:

Scalability	Agility	Control	Dramatic Cost Savings
The Pulse Secure Services Director can manage the lifecycle of thousands of ADC instances under the same shared resourcing pool. With a high-level view of ADC utilization across your data center and cloud deployments, the Pulse Secure Services Director helps you manage application delivery services across all your applications with a common resource model.	Deploy application delivery services in minutes, and exactly where needed to reduce time to market for new applications and services. Create new ADC instances on a per-application or per-tenant basis instantly, start and stop instances for service migration, and even pre-provision ADC instances for even faster "instant-on" services.	Orchestrate Layer 7 services within a virtualized architecture, and integrate into your network and service provisioning systems with a powerful REST-based API. Comprehensive reporting provides intuitive point-in-time information on utilization for service resources.	Optimize resources with enterprise-capacity management and usage model. Right-size your ADC services and save up to 50% in costs, compared to fixed-capacity ADC instances. The Pulse Secure Services Director tracks each instance and creates usage reports for monitoring and billing, and longer-term capacity planning: Enterprises can use this information to cross-charge to each business unit or application owner.

Actionable Insights

Visualize traffic flows and gain a deeper understanding of how your application handles transactions. With Enterprise Management tools for collecting rich application data, you have detailed information about flows throughout each application in real time. More than simply presenting streams of unstructured data, Pulse Services Director makes it easy to interact with the traffic flows, so you can drill down from high-level dashboards into detailed data flows, with visual cues to guide interpretation.

Figure 3. The Pulse Secure Virtual Web Application Firewall is available as an add-on option for the Pulse Secure Virtual Traffic Manager.

3. Pulse Secure Virtual Web Application Firewall

The Pulse Secure Virtual Web Application Firewall is scalable and application-aware, offering the highest protection and performance in Web and cloud application security. You can protect against known and unknown attacks at the application layer (e.g., OWASP Top10), secure your applications, and meet PCI-DSS compliance requirements with confidence.

Available as part of the Enterprise Edition of Pulse Secure Virtual Traffic Manager, as a stand-alone proxy solution, or as virtual or web server extension, it is the only full-featured application firewall to be supported in public cloud environments such as Amazon AWS, Google Cloud Platform and Microsoft Azure for a fully distributed application security platform.

4. Feature Tiers for Pulse Secure vADC

Pulse Secure vADC is available in two key feature tiers, the Advanced Edition, and Enterprise Edition.

Advanced Edition: Includes the most common load balancing capabilities, including SSL/TLS offload, session persistence, service level monitoring, simple TrafficScript Rule Builder, and support for IPv6 and HTTP/2. Also includes capabilities such as Global Load Balancing, Route Health Injection, and customisation using powerful TrafficScript scripting language and Java Extensions.

Enterprise Edition: Adds premium Layer 7 services such as Web Content Optimization (WCO) to accelerate page load times up to 4x for HTML applications, and Web Application Firewall (WAF) to block attacks such as SQL injection and cross-site scripting (XSS) and help achieve compliance with PCI- DSS and FIPS compliance.

Enterprise Management Nodes: Pulse Service Director can enable enhanced capabilities such as centralized backup and restore and advanced analytics to drill down into traffic flows.

Download for Free

The Pulse Secure Community Edition, available either as pure software, or as a virtual appliance, makes the complete ADC technology platform available to every application developer in your organization to develop applications faster, test them in a production identical environment, and bring them to market more quickly.

Download the Pulse Secure Community Edition today and test all of the available capabilities in the product family. Please visit: www.pulsesecure.net/trynow/vtm.

Maximizing Investments

To help optimize technology investments, Pulse Secure and its partners offer complete solutions that include professional services, technical support, and education. For more information, contact a Pulse Secure sales partner or visit www.pulsesecure.net.

About Pulse Secure

Pulse Secure, LLC offers easy, comprehensive Secure Access solutions that provide visibility and seamless, protected connectivity between users, devices, things and services. The company delivers suites that uniquely integrate cloud, mobile, application and network access to enable hybrid IT. More than 20,000 enterprises and service providers across every vertical entrust Pulse Secure to empower their mobile workforce to securely access applications and information in the data center and cloud while ensuring business compliance. Learn more at www.pulsesecure.net.
